6–12-month playbook

PAUL MCDONAGH-SMITH: So, Kanch, if you were advising, if you found yourself advising a senior leadership team on how to prepare for the next 6–12 months of generative AI and agentic evolution, what would be your top recommendations? Irrespective of industry or—

KANCHANA PATLOLLA: Yeah. I think the first thing I probably would talk about is I see many enterprises doing several comparisons, thinking about features which exist in one, which doesn't exist in others or even if it's product, they are, you know, very much worried about it. The thing is, the research is evol— as we just discussed, the research's evolution is much faster. The products are going to be much, you know, more, at a much higher scale, because every company is releasing in, like, days, not even weeks now. And the features are going to be on par in any provider. So, in my opinion, the use case or the comparison, which you want to run, should be much shorter. Like, you remember the world where six months, like, you know, that doesn't exist anymore.

MCDONAGH-SMITH: Yeah. Yeah.

PATLOLLA: Then you do it. Do it today. Evaluate whatever is best suited for your use case because there are some models which perform well in certain use case. There are some which performs well in other use cases. So you do want to pick the best model, but don't spend too much time on it. So that's going to be your first thing. Like, And the next thing I would say is getting the MVP out for any of your product should not be more than three weeks, because from your design board to the vision should not take more.

MCDONAGH-SMITH: So the creation, the kind of actual launch of an MVP, a minimum viable product, three week—

PATLOLLA: Yeah. Because for me so the minimum viable product when I talk about it, it's with, a less audience. Like, not more than five people or, like, you're doing a fishfeeding in your team.

MCDONAGH-SMITH: Yeah. Exactly.

PATLOLLA: And that fishfeeding, like, for me, three weeks is, like, a lot because we can build a prototype for a complex vision in less than—

MCDONAGH-SMITH:

PATLOLLA: Yes. Less than a weekend. So, that being said, the three weeks is is a good time frame for you to be able to go back and forth on the design, the requirements, what are the critical user journeys you want to cover. All of that is important, but that needs to be a kind of timeline you should have in your mind that, okay, I want to get this out.

So when I think about, the reason why I talked about it is when I think about 6 months, 12 months from now with respect to what I'm building as a strategy, you need to account that

you are running quick cycles and releasing things quicker. The reason I say that is, again, going back to whatever you're thinking of today might become outdated tomorrow. So when you're planning your journey, you are planning for what you know today. Even for me, I know whatever I know today, I'm planning for it. But we don't know what in two months or three months something comes out.

So your vision should be what are the product abilities I want to bring, which is your business objectives, and how soon can I get it to anywhere? It would be my first, you know, recommendation. Because, if you think about, oh, I want to launch this product 12 months from now and you do our previous world of, you know, planning and two months, three months— Of course, you need to test. You, of course, needs to, you know, go through the production launch patterns. But the fishfeeding, which we call within the team, and dogfooding, which is within the organization, should be much, much quicker. You need to get it stabilized to a point, but that would be my first recommendation. Do things quicker, faster, so you are, you know, rolling out things quicker.

And the next thing what I would recommend, the second recommendation, would be when you are thinking about the 6 months and 12-month strategy, think in terms of the business goals, but do not pick a tech stack or do not get married to a tech stack, which we all have done in the past. We all have. Like, you are in one vendor and you're going to be with that vendor. I think you need to create a culture in your organization where you are adopting to a different one much quicker, in my opinion. I know it's a harder problem, but I think that needs to be in your transformation journey.

And the third one, the last one, I'll stop here, is when you're thinking about the journey of how, the 6 months to 12 months look like, think from the user perspective of what would the user think from 6 months from now, but you don't know yet. Like, you are building a product or a future where we don't know what it's going to look like. And maybe some kind of a 10x workshop or things like that nature that gives you that vision is probably another good thing. Like, that's something I recommend to everyone.
